Killzall Family of Products

Super Killzall

One of our most popular products. 41% Glyphosate with two surfactants, so more that twice the strength of the regular home owner weed and grass killer, plus two spreader stickers to improve adhesion and absorption.

Killzall Aquatic Herbicide

This is a sleeper product, not everyone is aware it is available. 53.8% Glyphosate with no surfactant. This is a weed and grass killer that may be applied to and around waterways, being non-harmful to animals and plants living under the water. Also has a Great Brush label. Since a surfactant is not in this you must add *Spreader Sticker*.

Killzall Extend Control

This is your favorite Killzall product with a preventer that lasts up to 3 months. 40.15% Glyphosate with 7.51% Prodiamine with no surfactant. Yes this only lasts for 3 months, but the 32 oz concentrate covers up to 10,000 sq ft where the competition lasts for 4 months-1,500 sq ft or 6 months-750 sq ft. After the second year you spray bare ground and spot spray if you miss a spot. I always add *Spreader Sticker* to the mix, this is a little thick.

To the right → is a picture of an endcap display made up by my good friend Fred from Texas. Looks really good and can make an impact in a store. Fred always says "Stack it high and watch it fly!"

Nutsedge Control

This is your nut sedge product. The label specifically says "Must use non-ionic surfactant" (*Spreader Sticker*). This is a very unstable product, mix and spray immediately.

Remember, not all of the little nutlets will sprout this year so you may need to spray once per year for up to three years to be nutsedge free.

Weed Out with Q

This is our Crabgrass Control, Q stands for Quinclorac the crabgrass killing part. This is not very effective on old, slow growing crabgrass. To kill older, leggy crabgrass, mow or trim the crabgrass, allow it to heal for a couple of days, then apply and it will work fine. Always add *Spreader Sticker* to any mix when trying to kill grass. Oh yes, it kills broadleaf weeds as
